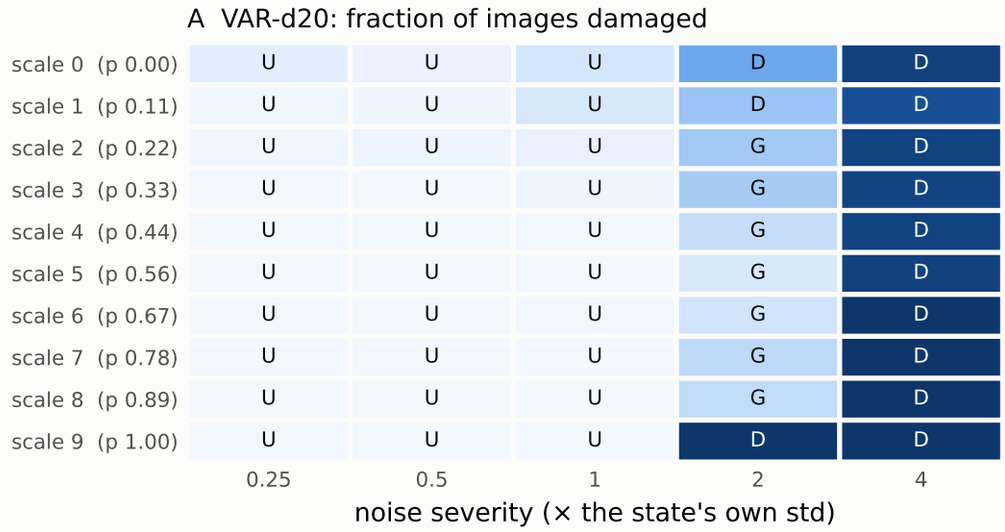
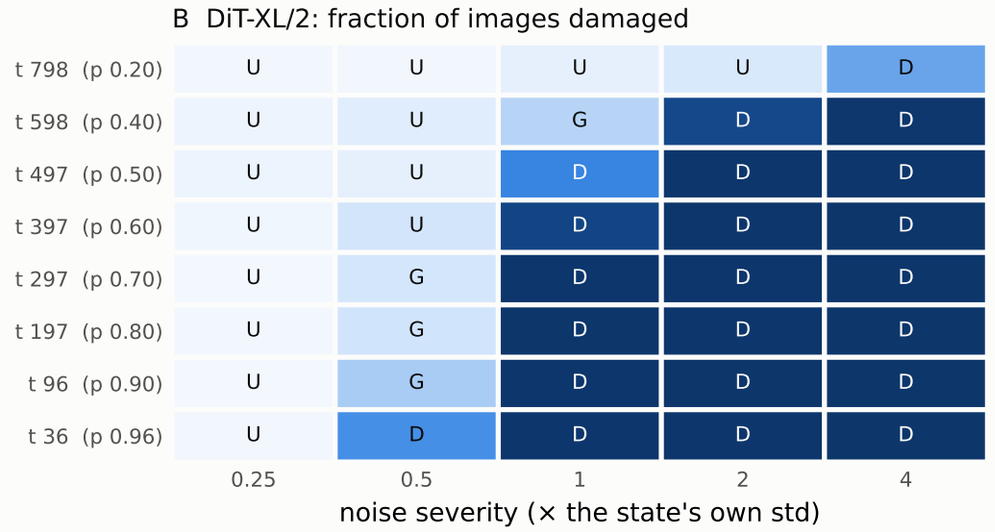
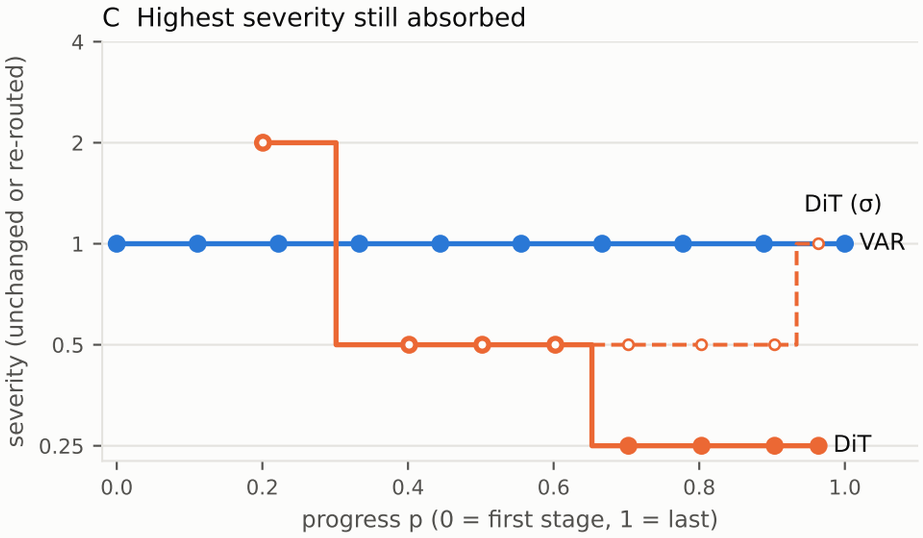
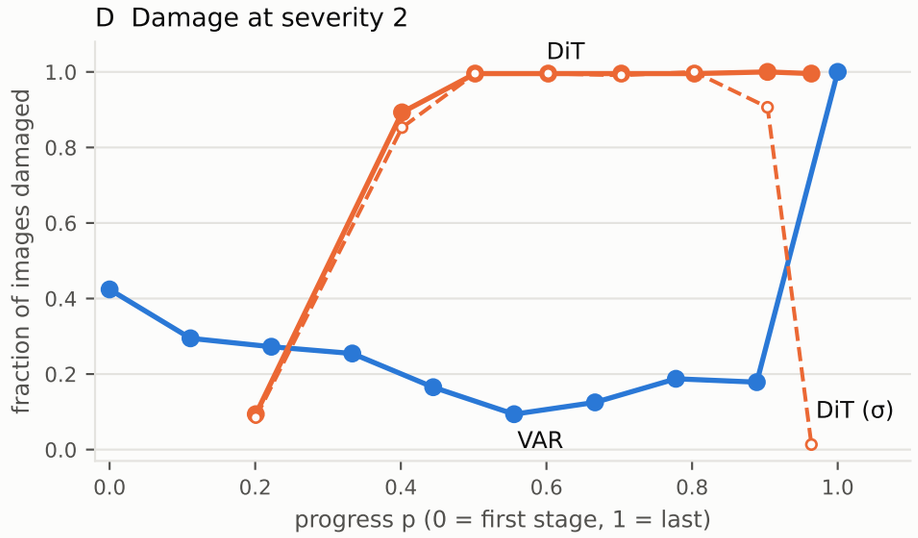
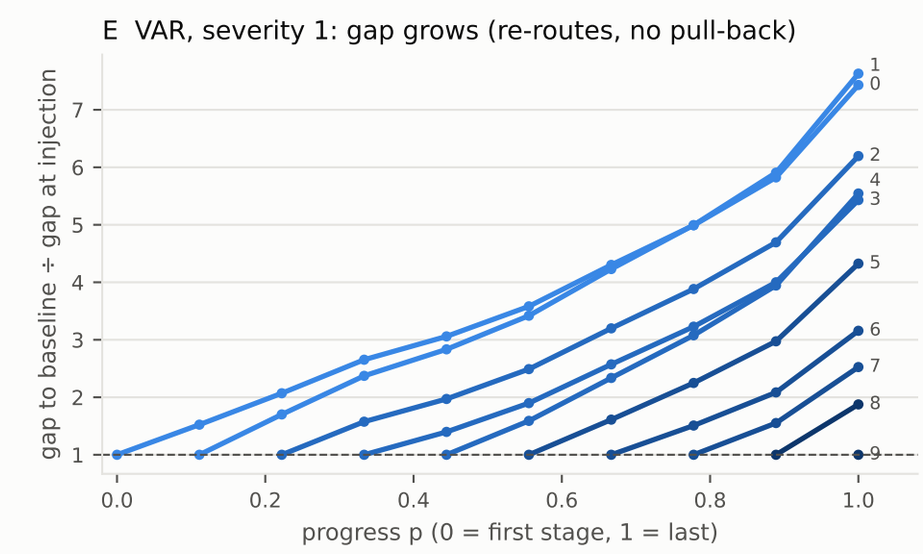
Figure 2. Corruption and recovery: noise injected at one stage of generation (224 images, 7 dog classes)

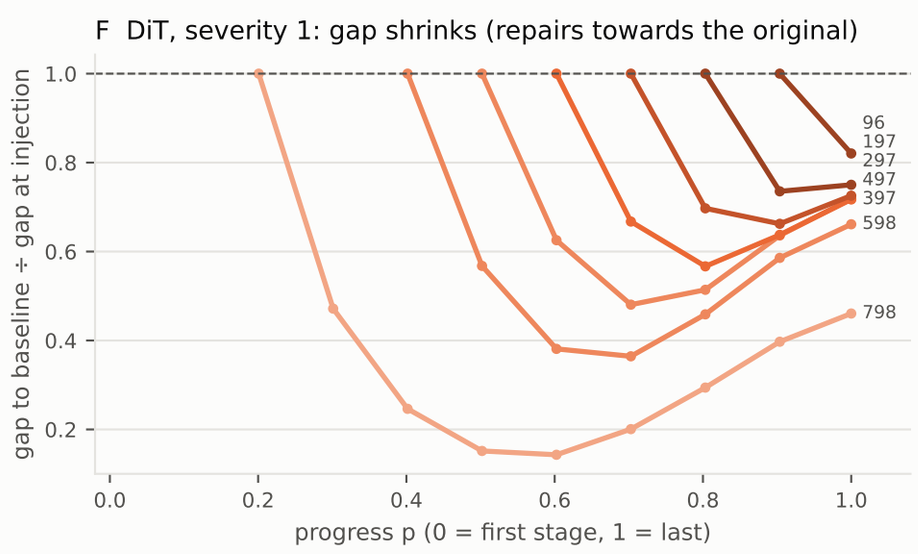












Cell letters (P3's rule, run level): U unchanged, R re-routed, G degraded-in-place, D damaged. E/F: lines labelled by injection stage; DiT t36 is not traced. Severities are matched by rule, not mechanism: compare trends across models, not values. C/D dashed, DiT (σ): severity in units of the step's own noise level (Phase E1, severities 0.5-2), under which DiT's last steps absorb the noise.
